

Kahng/Robins' Algorithm

□ Iterative 1-Steiner Insertion Algorithm

- Keep adding 1-Steiner point one-by-one until no more gain
- Find a 1-Steiner point by constructing a new MST on $n+1$ points for each element in the Steiner candidate set, and pick the candidate which results in the shortest MST
- Time complexity $O(n^3)$

Kahng/Robins' Algorithm Example

□ Perform 1-Steiner Routing by Kahng/Robins

- Need an initial MST: wirelength is 20
- 16 locations for Steiner points

(a)

(b) WL=20

(c)

Kahng/Robins' Algorithm Example

□ First 1-Steiner Point Insertion

- Total of six 1-steiner point candidates, pick (c) or (d)

Before insertion

(a) WL=19

(b) WL=19

(c) WL=18

(d) WL=18

(e) WL=19

(f) WL=19

Kahng/Robins' Algorithm Example

□ Second 1-Steiner Point Insertion

- Total of three 1-steiner point candidates
- Need to break tie again, note that (a) and (b) do not contain any more 1-Steiner point: so we choose (c)

Before insertion

(a) WL=17

(b) WL=17

(c) WL=17

Kahng/Robins' Algorithm Example

□ Third 1-Steiner Point Insertion

- Tree completed: all edges are rectilinearized
- Overall wirelength reduction = $20 - 16 = 4$

WL=20

Before

WL=16

After
